Proctor-Caching Checklist

ProctorCache is optional software that works with TestNav to deliver pre-cached test content. A caching computer downloads and stores test data, such as multimedia files or test questions, and then serves that data to individual test computers from within the local network. ***For low bandwidth environments***, this provides faster content-load times for more efficient test taking.

Proctor-Caching Checklist

1. Understand and meet ProctorCache system requirements.
2. Install ProctorCache.
3. Create a configuration.
4. Precache your test content.
